Example of a shear band in an outcrop of Scaglia Rossa at Monte Castello, Arquà Petrarca (PD).

Non-gradient elastoplasticity

Gradient elastoplasticity

Some introductory notions

Developing mechanical models through the principle of virtual powers

Description of a mechanical system

The systems are the elements z of a separable and reflexive Banach space Z .

Generalized forces are the elements $\mathcal{F}$ of the dual space Z^* .

Developing mechanical models through the principle of virtual powers

Description of a mechanical system

The systems are the elements z of a separable and reflexive Banach space Z .

Generalized forces are the elements $\mathcal{F}$ of the dual space Z^* .

Equilibrium

Equilibrium is the balance

$$-\mathcal{I}(t) + \mathcal{X}(t) = 0 \quad \text{for a.e. } t \in (0, T)$$

between internal forces $\mathcal{I}: (0, T) \rightarrow Z^*$ and external forces $\mathcal{X}: (0, T) \rightarrow Z^*$.

between internal forces $\mathcal{I}: (0, T) \rightarrow Z^*$ and external forces $\mathcal{X}: (0, T) \rightarrow Z^*$.

Constitutive relations

Let $\Psi: Z \rightarrow \mathbb{R} \cup \{0\}$ be the free energy and $\Phi: Z \rightarrow [0, \infty]$ the dissipation potential.

Internal forces are related to the evolution $z: [0, T] \rightarrow Z$ with a constitutive relation

$$\mathcal{I}(t) \in D\Psi(z(t)) + \partial\Phi(\dot{z}(t)) \quad \text{for a.e. } t \in (0, T).$$

DEFINITION. $\xi \in \partial\Phi(v)$ if $\Phi(w) \geq \Phi(v) + \langle \xi, w - v \rangle$ for all $w \in Z$.

PROPOSITION. If Φ is convex and $\Phi(0) = 0$ then $\langle \xi, v \rangle \geq 0$ for all $\xi \in \partial\Phi(v)$.

COROLLARY. $\frac{d}{dt}\Psi(z(t)) \leq \langle \mathcal{I}(t), \dot{z}(t) \rangle = \langle \mathcal{X}(t), \dot{z}(t) \rangle$.

Developing mechanical models through the principle of virtual powers

Description of a mechanical system

The systems are the elements z of a separable and reflexive Banach space Z .

Generalized forces are the elements $\mathcal{F}$ of the dual space Z^* .

Equilibrium

Equilibrium is the balance

$$-\mathcal{J}(t) + \mathcal{X}(t) = 0 \quad \text{for a.e. } t \in (0, T)$$

between internal forces $\mathcal{J}: (0, T) \rightarrow Z^*$ and external forces $\mathcal{X}: (0, T) \rightarrow Z^*$.

PROBLEM. Given $z_0 \in Z$ and $\mathcal{X}$ find z such that $z(0) = z_0$ and equilibrium holds.

$\implies$

Constitutive relations

Let $\Psi: Z \rightarrow \mathbb{R} \cup \{0\}$ be the free energy and $\Phi: Z \rightarrow [0, \infty]$ the dissipation potential.

Internal forces are related to the evolution $z: [0, T] \rightarrow Z$ with a constitutive relation

$$\mathcal{J}(t) \in D\Psi(z(t)) + \partial\Phi(\dot{z}(t)) \quad \text{for a.e. } t \in (0, T).$$

DEFINITION. $\xi \in \partial\Phi(v)$ if $\Phi(w) \geq \Phi(v) + \langle \xi, w - v \rangle$ for all $w \in Z$.

PROPOSITION. If Φ is convex and $\Phi(0) = 0$ then $\langle \xi, v \rangle \geq 0$ for all $\xi \in \partial\Phi(v)$.

COROLLARY. $\frac{d}{dt}\Psi(z(t)) \leq \langle \mathcal{J}(t), \dot{z}(t) \rangle = \langle \mathcal{X}(t), \dot{z}(t) \rangle$.

Doubly nonlinear equation

$$D\Psi(z(t)) + \partial\Phi(\dot{z}(t)) \ni \mathcal{X}(t)$$

for a.e. $t \in (0, T)$

Modeling dilatant and pressure sensitive elastoplastic materials

Classical approach

Kinematics

The space of configurations is $Z = \{z = (u, E_p)\}$ with

the displacement $u \in H^1(\Omega, \mathbb{R}^d)$

the plastic strain $E_p \in H^1(\Omega, \text{Sym})$.

The elastic strain is $E_e = E u - E_p$.

The generic rate is $w = (v, V_p)$ and the elastic rate is $V_e = E v - V_p$.

Classical approach

Kinematics

The space of configurations is $Z = \{z = (u, E_p)\}$ with

the displacement $u \in H^1(\Omega, \mathbb{R}^d)$

the plastic strain $E_p \in H^1(\Omega, \text{Sym})$.

The elastic strain is $E_e = E u - E_p$.

The generic rate is $w = (v, V_p)$ and the elastic rate is $V_e = E v - V_p$.

Statics

The internal generalized force is

$$\langle \mathcal{I}, w \rangle = \int_{\Omega} [T_e : V_e + T_p : V_p] \, dx$$

with $T_e : \Omega \rightarrow \text{Sym}$ the elastic stress, $T_p : \Omega \rightarrow \text{Sym}$ the plastic force. The external generalized force is

$$\langle \mathcal{X}, w \rangle = \int_{\Omega} f \cdot v \, dx + \int_{\partial\Omega} h \cdot v \, dx.$$

PROPOSITION. The strong form of the equilibrium is

$$\begin{aligned} \operatorname{div} T_e + f &= 0 \\ T_e - T_p &= 0 \end{aligned} \quad \text{in } \Omega$$

and $T_e n = h$ in $\partial\Omega$.

Classical approach

Constitutive relations

Let the free energy

$$\Psi(z) = \int_{\Omega} \frac{1}{2} \mathfrak{C} E_e : E_e \, dx,$$

so that $T_e = \mathfrak{C} E_e$.

Yield condition and non-associated flow rule

Fix $f, g: \text{Sym} \rightarrow \mathbb{R}$ convex. Let $C = \{f \leq 0\}$ and $L(T_p) = \{g \leq g(T_p)\}$.

Impose that $T_p \in C$. The yield condition is $T_p \in \partial C$ and the flow rule is

$$\dot{E}_p \in \begin{cases} \{0\} & \text{if } T_p \in \text{int } C \\ N_{L(T_p)}(T_p) & \text{if } T_p \in \partial C. \end{cases}$$

PROPOSITION. If $f = g$, is equivalent to $T_p \in \partial \sigma_C(\dot{E}_p)$ with $\sigma_C(\dot{E}_p) = \sup_{T_p \in C} T_p : \dot{E}_p$ so that

$$\Phi(w) = \int_{\Omega} \sigma_C(V_p) \, dx.$$

EXAMPLE. Drucker–Prager yield criterion

$$f(T_p) = |\text{dev } T_p| - \left(f_0 - a \frac{\text{tr } T_p}{d} \right)$$

$$g(T_p) = |\text{dev } T_p| + b \frac{\text{tr } T_p}{d}$$

with $0 \leq b \leq a$.

The flow rule $\dot{E}_p = \gamma \frac{\partial g}{\partial T_p}(T_p)$ implies

$$\text{dev } \dot{E}_p = \gamma \frac{\text{dev } T_p}{|\text{dev } T_p|}, \quad \text{tr } \dot{E}_p = b |\text{dev } \dot{E}_p|$$

with $\gamma f(T_p) = 0$, $f(T_p) \leq 0$ and $\gamma \geq 0$.

Proposal of an alternative approach

Kinematics

The space of configurations is $Z = \{z = (\mathbf{u}, \pi, \alpha, \lambda)\}$

the displacement $\mathbf{u} \in H^1(\Omega, \mathbb{R}^d)$

the deviatoric plastic strain $\pi \in H^1(\Omega, \text{DevSym})$

the damage variable $\alpha \in H^1(\Omega)$

the volumetric plastic strain $\lambda \in L^2(\Omega)$

Let $E_p = \pi + \frac{\lambda}{d} I$ and $E_e = E\mathbf{u} - E_p$.

Proposal of an alternative approach

Kinematics

The space of configurations is $Z = \{z = (\mathbf{u}, \pi, \alpha, \lambda)\}$

the displacement $\mathbf{u} \in H^1(\Omega, \mathbb{R}^d)$

the deviatoric plastic strain $\pi \in H^1(\Omega, \text{DevSym})$

the damage variable $\alpha \in H^1(\Omega)$

the volumetric plastic strain $\lambda \in L^2(\Omega)$

Let $E_p = \pi + \frac{\lambda}{d} I$ and $E_e = E\mathbf{u} - E_p$.

Notation for virtual rates

The generic rate is $\mathbf{w} = (\mathbf{v}, \rho, \beta, \mu)$, the plastic rate is $V_p = \rho + \frac{\mu}{d} I$ and the elastic rate is $V_e = E\mathbf{v} - V_p$.

Proposal of an alternative approach

Kinematics

The space of configurations is $Z = \{z = (\mathbf{u}, \pi, \alpha, \lambda)\}$
the displacement $\mathbf{u} \in H^1(\Omega, \mathbb{R}^d)$
the deviatoric plastic strain $\pi \in H^1(\Omega, \text{DevSym})$
the damage variable $\alpha \in H^1(\Omega)$
the volumetric plastic strain $\lambda \in L^2(\Omega)$

Let $E_p = \pi + \frac{\lambda}{d} I$ and $E_e = E\mathbf{u} - E_p$.

Addition of a constrain

Add the constrain $z \in K = \{\lambda = L(\alpha)\}$ with $L: \mathbb{R} \rightarrow \mathbb{R}$

$$\int_{\Omega} (\lambda - L(\alpha)) q \, dx = 0 \quad \text{for all } q \in L^2(\Omega).$$

Micropressure

Parametrize the constraint reaction $\mathcal{P} \in -N_K(z)$ as

$$\langle \mathcal{P}, w \rangle = \int_{\Omega} p(\mu - L'(\alpha)\beta) \, dx$$

with $p \in L^2(\Omega)$ the micropressure.

Notation for virtual rates

The generic rate is $w = (\mathbf{v}, \rho, \beta, \mu)$, the plastic rate is $V_p = \rho + \frac{\mu}{d} I$ and the elastic rate is $V_e = E\mathbf{v} - V_p$.

$$\text{EXAMPLE. } L(\alpha) = b \alpha_0 \left[1 - \exp\left(-\frac{\alpha}{\alpha_0}\right) \right]$$

Proposal of an alternative approach

Statics

The internal generalized force is

$$\begin{aligned}\langle \mathcal{J}, w \rangle = & \int_{\Omega} \left[T : E v + K : \dot{\text{grad}}^2 v \right] dx + \\ & + \int_{\Omega} \left[T_e : V_e + T_p : \rho + K_p : \dot{\text{grad}} \rho \right] dx + \\ & + \int_{\Omega} [\tau \beta + \kappa \cdot \text{grad} \beta] dx\end{aligned}$$

with $T: \Omega \rightarrow \text{Sym}$ the macroscopic stress, $K: \Omega \rightarrow \text{Lin} \otimes \mathbb{R}$ the macroscopic hyperstress, $T_e: \Omega \rightarrow \text{Sym}$ the elastic stress, $T_p: \Omega \rightarrow \text{DevSym}$ the plastic force, $K_p: \Omega \rightarrow \text{DevSym} \otimes \mathbb{R}$ the plastic stress, $\tau: \Omega \rightarrow \mathbb{R}$ the damage force and $\kappa: \Omega \rightarrow \mathbb{R}^d$ the damage stress. The external generalized force is

$$\langle \mathcal{X}, w \rangle = \int_{\Omega} f \cdot v dx + \int_{\partial\Omega} h \cdot v dx.$$

The equilibrium is $-\mathcal{J} + \mathcal{X} + \mathcal{P} = 0$.

PROPOSITION. The strong form of the equilibrium is

$$\begin{aligned}\text{div}(T + T_e - \text{div} K) + f &= 0 \\ \text{dev} T_e - T_p + \text{div} K_p &= 0 \\ -\tau + \text{div} \kappa - L'(\alpha)p &= 0 \\ p &= -\frac{\text{tr} T_e}{d}\end{aligned}$$

in Ω and $T_e n = h$, $K_p n = 0$, $\kappa \cdot n$ in $\partial\Omega$.

Proposal of an alternative approach

Constitutive relations

Let the free energy be $\Psi(z) = \frac{1}{2} \langle \mathcal{A}z, z \rangle + \Psi_0(z)$ with

$$\begin{aligned} \frac{1}{2} \langle \mathcal{A}z, z \rangle = \frac{1}{2} \int_{\Omega} [a |\operatorname{grad}^2 u|^2 + \\ + b |\operatorname{grad} \pi|^2 + \\ + c |\operatorname{grad} \alpha|^2] dx \end{aligned}$$

and

$$\Psi_0(z) = \int_{\Omega} \left[\frac{1}{2} \mathfrak{C} E_e : E_e + W_d(\alpha) \right] dx.$$

Let the dissipation potential be $\Phi(p, w) = \frac{1}{2} \langle \mathcal{D}h, h \rangle + \Phi_0(p, h)$ with

$$\frac{1}{2} \langle \mathcal{D}h, h \rangle = \frac{1}{2} \int_{\Omega} [\mathfrak{D} E v : E v + \mathfrak{d} |\rho|^2 + \epsilon |\beta|^2] dx$$

and

$$\Phi_0(p, h) = \int_{\Omega} [R(p, \rho) + Q(\rho, \beta)] dx.$$

EXAMPLE.

$$W_d(\alpha) = f_0 \alpha_1 \left[1 - \exp \left(-\frac{\alpha}{\alpha_1} \right) \right]$$

$$R(p, \rho) = Y p^+ |\rho|$$

$$Q(\rho, \beta) = \begin{cases} 0 & \text{if } \beta \geq |\rho| \\ \infty & \text{if } \beta < |\rho|. \end{cases}$$

REMARK. This impose $\dot{\alpha} \geq |\dot{\pi}|$.

Recovering the classical model, well-posedness result and numerics

Well-posedness result

Existence, uniqueness and continuous dependence on the data for the constrained doubly nonlinear equation

$$\begin{aligned} D_y \Psi_0(z(t)) + \mathcal{A}y(t) + \\ + \partial_h \Phi_0(p(t), \dot{y}(t)) + \mathcal{D}\dot{y}(t) - \\ - \mathcal{L}'(y(t))^* p(t) \ni \mathcal{X}(t) \end{aligned}$$

$$D_\lambda \Psi_0(z(t)) + p(t) = 0$$

$$\lambda(t) = \mathcal{L}(y(t)).$$

Equivalence with the classical approach

If suitable constitutive relations are chosen then

our approach $\iff$ Drucker–Prager model

Numerics

Thank you for your attention.

Further explanations of the general theoretical framework

A simple example

A block on the plane with friction pulled with a spring.

The space of configurations is $Z = \{z = (x, x_b) \in \mathbb{R}^2\}$. Let $w = (v, v_b)$ the generic rate of the system.

The free energy is $\Psi(z) = \frac{\kappa}{2}|x - x_b|^2$ while the dissipation potential is $\Phi(w) = Y|v_b| + \frac{\eta}{2}|v_b|^2$.

Start with $z(0) = (0, 0)$.

PROPOSITION. It holds that

$$\partial\Phi(v_b) = \begin{cases} [-Y, Y] & \text{if } v_b = 0 \\ \{Y \operatorname{sign} v_b + \eta v_b\} & \text{if } v_b \neq 0. \end{cases}$$

SOLUTION. It holds that $x = x_b + \frac{F}{\kappa}$. Moreover $\dot{x}_b = 0$ when $F < Y$ while $F = Y + \eta \dot{x}_b$ when $F \geq Y$.

Treating constraints with the method of Lagrange multipliers

Constrained kinematics

Let $K \subset Z$ closed and convex and impose the constraint $z(t) \in K$ for all $t \in [0, T]$.

Reaction force

Add a reaction force $\mathcal{P}: (0, T) \rightarrow Z^*$ satisfying $\mathcal{P}(t) \in -N_K(z(t)) = -\partial \iota_K(z(t))$ for a.e. $t \in (0, T)$.

Equilibrium

The equilibrium now reads

$$-\mathcal{J}(t) + \mathcal{X}(t) + \mathcal{P}(t) = 0 \quad \text{for a.e. } t \in (0, T).$$

PROBLEM. Given $z_0 \in Z$ and $\mathcal{X}$ find z and $\mathcal{P}$ such that $z(0) = z_0$, $z(t) \in K$ for all $t \in [0, T]$, $\mathcal{P}(t) \in -N_K(z(t))$ for a.e. $t \in (0, T)$ and equilibrium holds.

$\Rightarrow$

Constitutive relations

Let again $\Psi: Z \rightarrow \mathbb{R} \cup \{0\}$ be the free energy.

Now the dissipation potential $\Phi: Z^* \times Z \rightarrow [0, \infty]$, $(\mathcal{P}, w) \mapsto \Phi(\mathcal{P}, w)$ can depend on the reaction force.

The constitutive relations become

$$\mathcal{J}(t) \in D\Psi(z(t)) + \partial_w \Phi(\mathcal{P}(t), \dot{z}(t))$$

for a.e. $t \in (0, T)$.

Constrained doubly nonlinear equation

$$z(t) \in K \quad \text{for all } t \in [0, T]$$

$$\mathcal{P}(t) \in -N_K(z(t))$$

$$D\Psi(z(t)) + \partial \Phi(\mathcal{P}(t), \dot{z}(t)) \ni \mathcal{X}(t) + \mathcal{P}(t)$$

for a.e. $t \in (0, T)$

Further details on the models for dilatant and pressure sensitive elastoplastic materials

Recovering the classical Ducker–Prager model

PROPOSITION. Letting $L(\alpha) = b\alpha$, $W_d(\alpha) = f_0\alpha$, $R(p, \rho) = Yp|\rho|$ with $Y = \alpha - b$ we recover the Drucker–Prager model.

SKETCH OF THE PROOF. For simplicity disregard viscous and gradient terms. Recall the balance

$$\begin{aligned}\operatorname{dev} T_e - T_p &= 0 \\ -\tau - L'(\alpha)p &= 0.\end{aligned}$$

This becomes

$$\begin{aligned}\operatorname{dev} T_e &\in (\alpha - b)\partial|\cdot|(\dot{\pi}) + \partial_\rho Q(\dot{\pi}, \dot{\alpha}) \\ f_0 + bp &\in -\partial_\beta Q(\dot{\pi}, \dot{\alpha}).\end{aligned}$$

The choice $Y = \alpha - b$ weights correctly the contributions of plastic deviatoric and damage resistance to provide the right yield condition

$$|\operatorname{dev} T_e| \leq f_0 + \alpha p.$$

The flow rule is satisfied since $\dot{\lambda} = b\dot{\alpha} = b|\dot{\pi}|$. $\square$

RECALL. Drucker–Prager yield criterion

$$\begin{aligned}f(T_p) &= |\operatorname{dev} T_p| - \left(f_0 - \alpha \frac{\operatorname{tr} T_p}{d}\right) \\ g(T_p) &= |\operatorname{dev} T_p| + b \frac{\operatorname{tr} T_p}{d}\end{aligned}$$

with $0 \leq b \leq \alpha$.

The flow rule $\dot{E}_p = \gamma \frac{\partial g}{\partial T_p}(T_p)$ implies

$$\operatorname{dev} \dot{E}_p = \gamma \frac{\operatorname{dev} T_p}{|\operatorname{dev} T_p|}, \quad \operatorname{tr} \dot{E}_p = b |\operatorname{dev} \dot{E}_p|$$

with $\gamma f(T_p) = 0$, $f(T_p) \leq 0$ and $\gamma \geq 0$.

Recovering the classical Ducker–Prager model

PROPOSITION. Letting $L(\alpha) = b\alpha$, $W_d(\alpha) = f_0\alpha$, $R(p, \rho) = Yp|\rho|$ with $Y = a - b$ we recover the Drucker–Prager model.

SKETCH OF THE PROOF. For simplicity disregard viscous and gradient terms. Recall the balance

$$\begin{aligned} \operatorname{dev} T_e - T_p &= 0 \\ -\tau - L'(\alpha)p &= 0. \end{aligned}$$

This becomes

$$\begin{aligned} \operatorname{dev} T_e &\in (a - b)\partial|\cdot|(\dot{\pi}) + \partial_\rho Q(\dot{\pi}, \dot{\alpha}) \\ f_0 + bp &\in -\partial_\beta Q(\dot{\pi}, \dot{\alpha}). \end{aligned}$$

The choice $Y = a - b$ weights correctly the contributions of plastic deviatoric and damage resistance to provide the right yield condition

$$|\operatorname{dev} T_e| \leq f_0 + ap.$$

The flow rule is satisfied since $\dot{\lambda} = b\dot{\alpha} = b|\dot{\pi}|$. $\square$

LEMMA. When $\dot{\pi} \neq 0$ and $\dot{\alpha} = |\dot{\pi}|$ the generic element of $\partial Q(\dot{\pi}, \dot{\alpha})$ is $(-\theta \frac{\dot{\pi}}{|\dot{\pi}|}, \theta)$ with $\theta \leq 0$. When $\dot{\pi} = 0$ and $\dot{\alpha} = 0$ is (Θ, θ) with $\theta \leq 0$ and $\Theta \in \operatorname{DevSym}$ with $|\Theta| \leq |\theta|$.

Notation

Define

$$Y = \{y = (u, \pi, \alpha)\}, \quad \Lambda = \{\lambda\}, \quad \Lambda^* = \{p\}.$$

and $\mathcal{L}: Y \rightarrow \Lambda$ by $\mathcal{L}(y) = L(\alpha)$. Denote the virtual rate as $w = (h, \mu)$ with $h = (v, \rho, \beta) \in Y$ and $\mu \in \Lambda$. Then

$$\lambda = \mathcal{L}(y)$$

$$\langle \mathcal{P}, w \rangle = \langle p, \mu \rangle - \langle \mathcal{L}'(y)^* p, h \rangle.$$

Existence and uniqueness theorem

Let $H = \{y = (u, \pi, \alpha)\}$ with $u \in H^1(\Omega, \mathbb{R}^d)$, $\pi \in L^2(\Omega, \text{DevSym})$ and $\alpha \in L^2(\Omega)$.

Assume that

- L is bounded, differentiable and with bounded and Lipschitz derivative
- W_d is differentiable with Lipschitz derivative
- $R(p, \rho) = Y(p)\tilde{R}(\rho)$ with Y positive and Lipschitz, $\tilde{R}: \text{DevSym} \rightarrow [0, \infty)$ convex, Lipschitz and $\tilde{R}(0) = 0$
- $Q: \text{DevSym} \times \mathbb{R} \rightarrow [0, \infty]$ is positive convex, l.s.c. Lipschitz on its domain and $Q(0, 0) = 0$.

THEOREM. There exist a unique solution $z = (y, \lambda)$ and p with $z(0) = 0$, $y \in W^{1,\infty}((0, T); Y)$, $\dot{y} \in C^0([0, T], H)$, $\lambda \in C^0([0, T], \Lambda)$ and $p \in C^0([0, T], \Lambda^*)$. Moreover these quantities depend continuously on the data with respect to the norms of their spaces.

Existence and uniqueness

Formulation of the problem

Assume homogeneous boundary conditions. Given $f \in H^1((0, T), H^{-1}(\Omega, \mathbb{R}^d))$ let

$$\langle \mathcal{X}(t), h \rangle = \langle f(t), v \rangle$$

PROBLEM. Find $z = (y, \lambda): [0, T] \rightarrow Z$ and $p: [0, T] \rightarrow \Lambda^*$ such that $z(0) = 0$ and

$$\begin{aligned} D_y \Psi_0(z(t)) + \mathcal{A}y(t) + \\ + \partial_h \Phi_0(p(t), \dot{y}(t)) + \mathcal{D}\dot{y}(t) - \\ - \mathcal{L}'(y(t))^* p(t) \ni \mathcal{X}(t) \end{aligned}$$

$$D_\lambda \Psi_0(z(t)) + p(t) = 0$$

$$\lambda(t) = \mathcal{L}(y(t))$$

for a.e. $t \in (0, T)$.

Existence and uniqueness theorem

Let $H = \{y = (u, \pi, \alpha)\}$ with $u \in H^1(\Omega, \mathbb{R}^d)$, $\pi \in L^2(\Omega, \text{DevSym})$ and $\alpha \in L^2(\Omega)$.

Assume that

- L is bounded, differentiable and with bounded and Lipschitz derivative
- W_d is differentiable with Lipschitz derivative
- $R(p, \rho) = Y(p)\tilde{R}(\rho)$ with Y positive and Lipschitz, $\tilde{R}: \text{DevSym} \rightarrow [0, \infty)$ convex, Lipschitz and $\tilde{R}(0) = 0$
- $Q: \text{DevSym} \times \mathbb{R} \rightarrow [0, \infty]$ is positive convex, l.s.c. Lipschitz on its domain and $Q(0, 0) = 0$.

THEOREM. There exist a unique solution $z = (y, \lambda)$ and p with $z(0) = 0$, $y \in W^{1,\infty}((0, T); Y)$, $\dot{y} \in C^0([0, T], H)$, $\lambda \in C^0([0, T], \Lambda)$ and $p \in C^0([0, T], \Lambda^*)$. Moreover these quantities depend continuously on the data with respect to the norms of their spaces.

Abstract existence and uniqueness for constrained doubly nonlinear equations

Assumptions

Let $Z = Y \times \Lambda$ with Y, Λ separable and reflexive Banach spaces. Let H a separable and reflexive Banach space such that $Y \subset H$ with compact and dense inclusion and

$$c_P \|y\|_Y \leq \|y\|_H + |y|_Y \leq C_P \|y\|_Y.$$

Let $\mathcal{L}: H \rightarrow \Lambda$ bounded, differentiable with bounded and Lipschitz differential.

Let $\Psi(z) = \Psi_0(z) + \frac{1}{2} \langle \mathcal{A}y, y \rangle$ and $\Phi(p, h) = \Phi_0(p, h) + \frac{1}{2} \langle \mathcal{D}h, h \rangle$ with

- $\Psi_0: H \times \Lambda \rightarrow \mathbb{R}$ Fréchet differentiable with Lipschitz differential
- $\mathcal{A} \in \mathcal{L}(Y, Y^*)$ self-adjoint and $\langle \mathcal{A}y, y \rangle \geq C_A |y|_Y^2$
- $\Phi_0: \Lambda^* \times H \rightarrow [0, \infty]$ with $\Phi_0(p, \cdot)$ convex, $\Phi_0(p, 0) = 0$, $|\Phi_0(p, h_1) - \Phi_0(p, h_2)| \leq C_\Phi (\|p\|_\Lambda + 1) \|h_1 - h_2\|_H$, $|\Phi_0(p_1, h) - \Phi_0(p_2, h)| \leq C_\Phi \|p_1 - p_2\|_{\Lambda^*} \|h\|_H$, $|\Phi_0(p_1, h_1) - \Phi_0(p_1, h_2) + \Phi_0(p_2, h_2) - \Phi_0(p_2, h_1)| \leq C_\Phi \|p_1 - p_2\|_{\Lambda^*} \|h_1 - h_2\|_H$
- $\mathcal{D} \in \mathcal{L}(H, H^*)$ self-adjoint and $\langle \mathcal{D}h, h \rangle \geq C_D \|h\|_H^2$

Abstract existence and uniqueness for constrained doubly nonlinear equations

Formulation of the problem

Let $\mathcal{X} \in H^1((0, T), H^*)$ assigned.

PROBLEM. Find $z = (y, \lambda): [0, T] \rightarrow Z$ and $p: [0, T] \rightarrow \Lambda^*$ such that $z(0) = 0$ and

$$\begin{aligned} D_y \Psi_0(z(t)) + \mathcal{A}y(t) + \\ + \partial_h \Phi_0(p(t), \dot{y}(t)) + \mathcal{D}\dot{y}(t) - \\ - \mathcal{L}'(y(t))^* p(t) \ni \mathcal{X}(t) \end{aligned}$$

$$D_\lambda \Psi_0(z(t)) + p(t) = 0$$

$$\lambda(t) = \mathcal{L}(y(t))$$

for a.e. $t \in (0, T)$.

Existence and uniqueness theorem

THEOREM. There exist a unique solution $z = (y, \lambda)$ and p with $z(0) = 0$, $y \in W^{1,\infty}((0, T); Y)$, $\dot{y} \in C^0([0, T], H)$, $\lambda \in C^0([0, T], \Lambda)$ and $p \in C^0([0, T], \Lambda^*)$. Moreover these quantities depend continuously on the data with respect to the norms of their spaces.

SKETCH OF THE PROOF. Discretize in time.

$$\begin{aligned} D_y \Psi_0(z_N^k) + \mathcal{A}y_N^k + \\ + \partial_h \Phi_0 \left(p_N^k, \frac{y_N^k - y_N^{k-1}}{\tau_N} \right) + \mathcal{D} \frac{y_N^k - y_N^{k-1}}{\tau_N} - \\ - \mathcal{L}'(y_N^k)^* p_N^k \ni \mathcal{X}_N^k \end{aligned}$$

$$D_\lambda \Psi_0(z_N^k) + p_N^k = 0$$

$$\lambda_N^k = \mathcal{L}(y_N^k).$$

Substitute the constraint in the first equation and consider the equation in y_N^k for each p_N^k fixed

$$\begin{aligned} D_y \Psi_0(\mathcal{L}(y_N^k), y_N^k) + \mathcal{A}y_N^k + \\ + \partial_h \Phi_0 \left(p_N^k, \frac{y_N^k - y_N^{k-1}}{\tau_N} \right) + \mathcal{D} \frac{y_N^k - y_N^{k-1}}{\tau_N} - \\ - \mathcal{L}'(y_N^k)^* p_N^k \ni \mathcal{X}_N^k. \end{aligned}$$

Abstract existence and uniqueness for constrained doubly nonlinear equations

Is of the form $F(y) + \partial \Xi(y) \ni 0$ with $F: H \rightarrow H^*$ continuous and $\Xi: Y \rightarrow [0, \infty]$ convex. Coercivity

$$\lim_{\|y\|_Y \rightarrow \infty} \frac{\Xi(y) + \langle F(y), y \rangle}{\|y\|_Y} = \infty$$

if τ is small thanks to viscosity. Minty–Browder theorem ensures that the solution $y_N^k = \mathcal{U}(p_N^k)$ exists unique for all p_N^k .

The second equation becomes

$$p_N^k = -D_\lambda \Psi_0(\mathcal{L}(\mathcal{U}(p_N^k)), \mathcal{U}(p_N^k)) = \mathcal{T}(p_N^k).$$

Existence is established with Schauder fixed-point theorem.

The discrete solution has been constructed. Let $\bar{y}_N, y_N$ be the piecewise constant and affine interpolations of y_N^k . Let $\hat{y}_N$ be the piecewise constant interpolation of $\dot{y}_N^k$.

A priori estimates gives y_N bounded in $W^{1,\infty}((0, T), Y)$ and $\hat{y}_N$ bounded in $L^2((0, T), H)$. By compactness

$$y_N \overset{*}{\rightharpoonup} y \quad \text{in } W^{1,\infty}((0, T), Y)$$

$$y_N \rightarrow y \quad \text{in } C^0([0, T], Y)$$

$$\bar{y}_N \rightarrow y \quad \text{in } L^2((0, T), Y)$$

$$\hat{y}_N \rightarrow \dot{y} \quad \text{in } L^2([0, T], H).$$

Letting $\lambda_N = \mathcal{L}(y_N)$, $\bar{\lambda}_N = \mathcal{L}(\bar{y}_N)$, $\lambda = \mathcal{L}(y)$, $p_N = -D_\lambda \Psi_0(z_N)$, $\bar{p}_N = -D_\lambda \Psi_0(\bar{z}_N)$, $p = -D_\lambda \Psi_0(z)$,

$$\lambda_N \rightarrow \lambda \quad \text{in } C^0([0, T], \Lambda)$$

$$\bar{\lambda}_N \rightarrow \lambda \quad \text{in } L^2((0, T), \Lambda)$$

$$p_N \rightarrow p \quad \text{in } C^0([0, T], \Lambda^*)$$

$$\bar{p}_N \rightarrow p \quad \text{in } L^2((0, T), \Lambda^*).$$

This allows to pass to the limit.

□

Contact torque as a Lagrange multiplier

Let $\Sigma \subset \Omega$ be an oriented smooth surface. Remove the constraint of continuity of $\frac{\partial u}{\partial n}$ across Σ and impose it with the method of Lagrange multipliers

$$\int_{\Sigma} \left\| \frac{\partial u}{\partial n} \right\| \cdot l \, dx = 0, \quad \langle \mathcal{M}, h \rangle = \int_{\Sigma} m \cdot \left\| \frac{\partial v}{\partial n} \right\| \, dx.$$

for all $l \in H^{-1/2}(\Sigma, \mathbb{R}^d)$. Here $m \in H^{-1/2}(\Sigma, \mathbb{R}^d)$ is the contact torque.

Let $Y_{\Sigma} = \{y = (u, \pi, \alpha)\}$ with $u \in H^1(\Omega, \mathbb{R}^d) \cap H^2(\Omega \setminus \Sigma, \mathbb{R}^d)$ and π, α as before.

PROBLEM. Find $z = (y, \lambda): [0, T] \rightarrow Y_{\Sigma} \times \Lambda$ and $p: [0, T] \rightarrow \Lambda^*$ such that $z(0) = 0$ and

$$\begin{aligned} D_y \Psi_0(z(t)) + \mathcal{A}y(t) + \\ + \partial_h \Phi_0(p(t), \dot{y}(t)) + \mathcal{D}\dot{y}(t) - \\ - \mathcal{L}'(y(t))^* p(t) \ni \mathcal{X}(t) + \mathcal{M}(t) \end{aligned}$$

$$D_{\lambda} \Psi_0(z(t)) + p(t) = 0$$

$$\lambda(t) = \mathcal{L}(y(t))$$

$$\left\| \frac{\partial u}{\partial n}(t) \right\| = 0 \quad \text{on } \Sigma$$

for a.e. $t \in (0, T)$.

Numerical approximation

Finite element spaces

Fix a triangulation $\mathcal{T}_l = \{K\}$ and define $\Sigma_l = \Omega \cap \bigcup_{K \in \mathcal{T}_l} \partial K$. Let

$$u \in H_0^1(\Omega, \mathbb{R}^2) \quad P2$$

$$\pi \in H^1(\Omega, \text{DevSym}) \quad P1$$

$$\alpha \in H^1(\Omega) \quad P1$$

$$\lambda \in L^2(\Omega) \quad P0$$

$$p \in L^2(\Omega) \quad P0$$

$$m \in H^{-1/2}(\Sigma_l, \mathbb{R}^d) \quad P0$$

and consider the finite element spaces $Y_l = \{y = (u, \pi, \alpha)\}$, $\Lambda_l = \{\lambda\}$, $P_l = \{p\}$ and $M_l = \{m\}$.

Notice that $u \in H_0^2(\Omega \setminus \Sigma_l, \mathbb{R}^2)$.

Numerical scheme

Fix time steps τ^k with $k \in \{1, \dots, N\}$.

PROBLEM. Find $z_\tau^k = (y_\tau^k, \lambda_\tau^k) \in Y_l \times \Lambda_l$, $p_\tau^k \in P_l$ and $m_\tau^k \in M_l$ such that $z^0 = 0$ and

$$\begin{aligned} & \left\langle D_y \Psi_0(z^k) + \mathcal{A} y^k + \right. \\ & \left. + D_h \Phi_0 \left(p^k, \frac{y^k - y^{k-1}}{\tau^k} \right) + \mathcal{D} \frac{y^k - y^{k-1}}{\tau^k} - \right. \\ & \left. - \mathcal{L}'(y^k)^* p^k - \mathcal{X}^k - \mathcal{M}^k, h \right\rangle = 0 \end{aligned}$$

$$\langle D_\lambda \Psi_0(z^k) + p^k, \mu \rangle = 0$$

$$\langle \lambda^k - \mathcal{L}(y^k), q \rangle = 0$$

$$\left\langle l, \left\| \frac{\partial u^k}{\partial n} \right\| \right\rangle = 0$$

for all $h \in Y_l$, $\mu \in \Lambda_l$, $q \in P_l$, $l \in M_l$ and $k \in \{1, \dots, N\}$.

Numerical approximation

Validation

Validate comparing with an analytical solution.

The solution is spatially homogeneous.

Regularize the dissipation potentials with the Yosida approximation

$$\tilde{R}_\eta(\rho) = \inf_{\xi \in \text{DevSym}} \left[\frac{|\rho - \xi|^2}{2\eta} + |\xi| \right]$$

$$Q_\eta = \frac{1}{2\eta} \text{dist}_{\text{dom } Q}(\rho, \beta)^2.$$

with $\eta > 0$.

Numerical approximation

An example

The aim is to show the formation of a shear band.

Let $\zeta > 0$ a multiplier of the gradient coefficients a , b , c .

Choose

$$a = \sqrt{2} \sin \phi \quad b = \sqrt{2} \sin \psi \quad f_0 = \sqrt{2}c \cos \phi$$

with $c > 0$ the cohesion, $\phi, \psi \in [0, 90^\circ)$ the friction and dilatancy angle.

Necking of a metallic cylindrical bar
